

There is an Overall Gain Trim Pot and a Slap Depth Trim Pot on the Control Cavity Cover. The Overall Gain controls the master output of the instrument. The Slap Contour Adjusts the level of the slap contour function when the switch thrown to the on position. Basically the slap contour function is a pre-determined EQ setting. When the slap contour switch is in the on position the Bass, Mid and Treble knobs are bypassed and do not effect the sound. When the Slap switch is in the off position the 3 band EQ functions normally.
